

Shopify API

Introduction

The document describes the steps of the Shopify API configuration and how to create new connection to link your store.

This document highlights the steps and importance of specific fields that are necessary to generate API Credentials and for creating a new connection with your Store.

Shopify Store Setting for API User

When your online Shopify store is created, you need to view the private app setting for connection and generate API credentials. With those API credentials you can use your **Private app** to access your store through the **Shopify API**. Steps to create API credentials are given in generate API Credentials and in last step Credentials are highlighted which are used for Connection with Extend.

Create New Store

1. Navigate to Shopify's website. Click on 'Get Started' to create your store.

A screenshot of the Shopify 'Create your store' form. It features three input fields: 'Email address', 'Password', and 'Your store name'. Below these fields is a green button labeled 'Create your store'.

2. Enter the required information about yourself:

A screenshot of the 'Tell us a little about yourself' form. It contains three dropdown menus: 'ARE YOU ALREADY SELLING?' (Please choose one...), 'HOW MUCH REVENUE DOES YOUR BUSINESS CURRENTLY MAKE IN A YEAR?' (Please choose one...), and 'ARE YOU SETTING UP A STORE FOR A CLIENT?' (Yes, I'm designing/developing a store for a client). A green 'Next' button is located at the bottom right.

3. Enter the required information in the 'Add an address so you can get paid' form.
4. Click on 'Enter my Store'.

Generate API Credentials

Once you have entered your store, go to

På denna sida:

- [Introduction](#)
- [Shopify Store Setting for API User](#)
 - [Create New Store](#)
 - [Generate API Credentials](#)
- [External System Connectors - Extend](#)
 - [Create New Connection](#)

1. Apps > View Private Apps

2. Click on **Generate API credentials**.

- 3. Enter Private App Name of your choice.
- 4. Select **Permissions** which are necessary for your app to work:

- 5. Now a description of each permission can be found in the API reference. With these credentials you can use your **Private app** to access your store through **Shopify API**. Copy the **API Key**, **password** and **host name** (storename.myshopify.com) for the connection with Extend.

Points to remember:

API Key: This is used as Access Token when we create a connection on the Extend side.

Password: This is used as a Secret when we create connection on the Extend side.

Host name: This is used as API URL on the Extend side when we create a connection (storename.myshopify.com).

External System Connectors - Extend

Extend helps you to manage orders, products, shipments and accounts of your online stores, e.g. Magento, Shopify, Fortnox etc. For this, you need to connect/link your online store with Extend.

Create New Connection

The following steps explains how to create a new connection.

1. Click on **External System Connectors** from **Settings**.
2. Click on the **Create New Connection** button.
A form opens where you need to enter basic data. Here information of your online store is used for connection creation. Important fields to be handled are:
 - a. **External System:** Select name of sales channel, e.g. Magento, Fortnox, Shopify etc.
 - b. **Access token:** API Key (Shopify) is used as access token here.
 - c. **API IRL:** Hostname (URL) of your online store (storename.myshopify.com).
 - d. **Secret:** Encrypted password (Shopify) is used as secret here.

The screenshot shows a web form titled "Create New Connection" with the following fields and controls:

- Name:** A text input field.
- External system:** A dropdown menu with a "v" icon.
- Access token:** A text input field.
- Secret:** A text input field.
- API URL:** A text input field.
- Order start:** A text input field.
- Warehouse:** A dropdown menu with a "v" icon.
- Company Group:** A dropdown menu with a "v" icon.
- At the bottom, there are two buttons: "Verify connection" and "Cancel".

3. Click on **'Verify Connection'**. It will verify your information (External System, Access token, Secret, API URL...) to create a connection.
